Q1-Design a detailed yet clean **UI/UX User Persona** for Minakshi Ghodella, a 21-year-old engineering student pursuing B.E. in Artificial Intelligence and Data Science in Pune, India.

Include the following sections:

1. **Personal Profile:** Name, age, education, location, occupation, devices and a short introduction.
2. **About Me:** A brief description of her lifestyle and daily use of technology.
3. **Goals:** Saving time, improving productivity, easy access to information and convenience.
4. **Needs:** Simple navigation, fast applications, useful features and secure platforms.
5. **Pain Points:** Slow loading, confusing layouts, unnecessary steps and technical issues.
6. **Technology Usage:** Smartphones, laptops, educational platforms, shopping apps and productivity tools.
7. **Behaviours:** Regular app usage, online research, comparing options and exploring new technologies.
8. **Motivations:** Learning, convenience, affordability and personal growth.
9. **Personality Traits:** Curious, practical, organized, independent and tech-savvy.
10. **User Quote:** "I prefer applications that are simple, useful and save my time."

Visual Design Instructions:
- Use a professional, realistic photograph of a young Indian female student.
- Create a structured A4 portrait layout.
- Use white as the main background with navy blue, muted blue and a little lavender.
- Arrange information in well-spaced sections using subtle borders and light-coloured backgrounds.
- Include small professional icons, clear headings and readable typography.
- Add enough information to make the persona look complete without overcrowding it.
- Maintain consistent alignment, balanced spacing and a polished academic presentation.

The final result should look like a genuine UX designer's work created in a design tool, not an AI-generated poster. Avoid cartoons, excessive gradients, animations, decorative graphics and unnecessary elements.

Q2-Design a simple desktop website wireframe for an **Online Learning Platform**.

Include only the main features:
- **Home Page:** Logo, navigation bar, search bar and welcome message.
- **Course Listings:** Course name, image, instructor and enroll button.
- **Video Lectures:** Video player, lecture title and lesson list.
- **Quizzes:** Questions, multiple-choice options and submit button.
- **Progress Tracking:** Progress bars, completed lessons and course percentage.

Use basic rectangular boxes, simple buttons, clear labels and a white background with light blue accents. Keep the layout neat, properly aligned and easy to understand. Make it look like a wireframe designed by a college student in 20–30 minutes. Avoid complex graphics, excessive colours and unnecessary features.

Q3 -Create simple wireframes and a clickable prototype for a **Social Fitness App** with these 6 screens:

1. **Home:** App name, daily activity and navigation.
2. **Workout:** Exercise name, duration, calories and log workout button.
3. **Goals:** Daily step target, workout target and progress.
4. **Friends:** Friend list and add friend option.
5. **Social Feed:** Share workouts, view friends' posts, like and comment.
6. **Progress:** Weekly workout history and progress summary.

Design: Use a clean white background with light blue and green accents. Keep buttons, cards, text and icons simple. Use consistent fonts, spacing and alignment. Add basic bottom navigation and connect screens using clickable buttons. Make it look like a neat, practical mobile app designed by a college student. Avoid decorative graphics, waves, gradients, complex illustrations and unnecessary elements.

Q4-Design a simple **Recipe Finder Mobile App UI** with 5 screens:

1. **Home:** App name, search bar and recipe categories.
2. **Search:** Ingredient search box and search button.
3. **Categories:** Breakfast, Lunch, Dinner and Snacks.
4. **Filters:** Vegetarian, Vegan, Gluten-Free and Low-Carb options.
5. **Recipe Details:** Recipe name, ingredients, cooking time and steps.

Design: Use a white background with light green accents. Create simple rectangular boxes, text fields, buttons and cards. Use a neat vertical layout with proper spacing and alignment. No images, illustrations, icons, gradients or decorative elements. Keep all screens consistent, clean and easy to navigate, like a student-created Figma practical.
add image space in 5th slide like of pasta of tomato and spinach pasta

5--Create a completely NEW UI/UX project from scratch named **ShopEase – Indian Online Shopping App**. This is a college practical project. Make it simple, realistic, attractive, and easy to use.

The project must include low-fidelity wireframes, high-fidelity UI screens, an interactive prototype, and a short usability testing section.

PART 1: LOW-FIDELITY WIREFRAMES

Create wireframes for these four mobile screens:

1. **Home:** App name, search bar, product categories, featured products, product cards, and bottom navigation.
2. **Product Details:** Product image placeholder, name, price, description, quantity selection, Add to Cart button, and back navigation.
3. **Shopping Cart:** Selected product, quantity controls, subtotal, total amount, Checkout button, and Continue Shopping option.
4. **Order Confirmation:** Successful order message, order summary, total amount, and Continue Shopping button.

Use simple rectangular boxes, lines, and labels. Keep wireframes basic and avoid decorative elements.

PART 2: HIGH-FIDELITY UI DESIGN

Create polished versions of all four screens.

Design requirements:
- White background with light blue and dark blue accents.
- Simple, readable typography.
- Consistent spacing and alignment.
- Clean rectangular cards and buttons.
- Subtle borders and shadows.
- Realistic product images.
- Simple, professional, student-made appearance.

Avoid gradients, waves, excessive icons, unnecessary illustrations, and complicated layouts.

Indian shopping context:

Use familiar Indian products with realistic prices in Indian Rupees (₹):

- Men's Cotton Kurta – ₹799
- Women's Ethnic Kurti – ₹599
- Wireless Earbuds – ₹1,299
- Stainless Steel Water Bottle – ₹399
- Casual Sneakers – ₹999
- Cotton Bedsheet Set – ₹699

Display all prices using ₹ (INR) consistently across every screen. Use an Indian delivery address example: Pune, Maharashtra, India. Use simple English. Do not use dollars or foreign currencies.

PART 3: INTERACTIVE PROTOTYPE

Create this shopping flow:

Home → Product Details → Cart → Order Confirmation

Required interactions:
- Clicking a product opens Product Details.
- Add to Cart opens the Cart.
- Checkout opens Order Confirmation.
- Back buttons return to the previous screen.
- Continue Shopping returns to Home.

Use On Click navigation. Set Home as the starting screen.

If automatic prototype connections are unavailable, organize and name the screens clearly so they can be connected manually in Figma's Prototype tab. Do not claim interactions are working unless they are connected.

PART 4: SHORT USABILITY TESTING

Create a compact section titled **Simulated Usability Testing**.

Include:

1. **Objective:** Check whether users can find a product, add it to the cart, and complete checkout.
2. **Testing Tasks:** Find a product, add it to the cart, and complete checkout.
3. **Simulated Feedback:** Show feedback from three simulated users in a small table with User, Observation, and Feedback columns.
4. **Issues Identified:** Mention 2–3 usability problems.
5. **Improvements Made:** Briefly explain the changes made to solve those problems.

Clearly label feedback as simulated, not actual participant research. Keep this section short. Do not create a lengthy report.

PART 5: PROJECT ORGANIZATION

Arrange the project into four clearly named sections:
1. Low-Fidelity Wireframes
2. High-Fidelity UI Screens
3. Interactive Prototype
4. Usability Testing

Keep all mobile screens the same size and aligned neatly. Maintain consistent colors, spacing, typography, and navigation.

Final instruction: Create everything from scratch in this new project. Keep the app simple, complete, realistic, and suitable for a college practical demonstration. Do not add unnecessary screens or features.

Ans - USABILITY TESTING – SHOPEASE

1. Objective

To evaluate whether users can easily browse products, view product details, add items to the cart, navigate back, and complete the checkout process.

2. Testing Tasks

1. Find and open the Men's Cotton Kurta from the Home screen.
2. View product details, use the Back button, and add the product to the cart.
3. Review the cart and click Checkout to reach the Order Confirmation screen.

3. Simulated User Observations

User	Task	Observation	Feedback
User 1	Find a product	Easily found and opened the product.	Product categories are clear.
User 2	Add to Cart	Needed a moment to locate the button.	Make Add to Cart more visible.
User 3	Place Order	Completed checkout successfully.	Show the final price clearly.

4. Usability Issues Identified

- Add to Cart button was not noticeable enough.
- Cart total needed better visibility.
- Back navigation needed to be clear.

5. Improvements Made

- Improved the visibility of the Add to Cart button.
- Highlighted the final cart amount.
- Added clear Back and Continue Shopping navigation.

6. Result

The updated prototype provides a simpler shopping journey, making it easier to browse products, navigate between screens, and complete the simulated checkout process.

Note: These are simulated usability observations and not feedback collected from actual participants. The prototype demonstrates order placement but does not process real payments.
